In summary, pharmacogenomics has current applications in the management of cardiovascular disease, with clinically relevant data continuing to mount.

Uncovering the causes of interpatient variability in drug response, and then using that information for the benefit of patients, is at the heart of clinical pharmacology.

With increased awareness about pharmacogenomics-based testing, patients may provide genetic information to their physicians to help inform drug product selection. In particular, direct-to-consumer companies have emerged that provide genotyping services for disease-risk and drug-response genes (34, 35). The information provided by these companies may allow consumers to require more personalized medical treatments from their physicians.

Pharmacogenomics is the study of how a patient ' s genome can influence how they respond to medicines. Variants in an individual ' s genome can increase the functioning of medicines or make them ineffective. They can also help predict which patients will suffer from side-effects – from the merely unpleasant to potentially life-threatening.

This report reviews a variety of patient care situations in which evidence is emerging to show patient benefit from pharmacogenomic (PGx) testing. Recent Findings Preemptive PGx testing minimizes delays in treatment, reducing costs and time to therapeutic effect; however, preemptive testing is currently not feasible in all healthcare settings.

Pharmacogenomics is advancing rapidly at the discovery, translational, and implementation levels. It is now clear that pharmacogenomics, as a clinical discipline, is being applied at the bedside to enhance the care of patients who are suffering from a variety of diseases and are being treated with a variety of drugs.
