A material's physical properties  
determine the physical state and  
appearance of different substances.  
These can include: Density - the  
weight of a material. Melting point -  
the minimum required temperature  
for a solid to become a liquid. Colour.  
Boiling Point - the minimum required  
temperature for a liquid to become a  
gas.

Updated October 16, 2019. A physical property is a characteristic of matter that can be observed and measured without changing the chemical identity of the sample. The measurement of a physical property can change the arrangement of matter in a sample but not the structure of its molecules. In other words, a physical property might involve a physical change but not a chemical change.

What are the physical properties of minerals? Minerals are the building blocks of rocks, and therefore are the building blocks of our planet's structure. They are specifically defined as naturally occurring, crystalline (as used in mineralogy, this means that they have an ordered internal structure) solids that are made inorganically, not by biological methods.
