Pneumatic Tube System for Hospital are highly complex systems which

perform a great variety of tasks.

Pneumatic Tube Systems For Hospitals

Pneumatic air tube systems have to fulfil high demands and are becoming increasingly prominent in the capital plans of hospitals and other healthcare establishments as a cost-effective method of improving the quality of service to patients.

The ministry's central o. And m. Unit has made a general examination of the value of pneumatic tube systems in the work of national health service hospitals including detailed studies of pneumatic tube systems in this country. This report describes the results of these studies. Pneumatic tube communication systems are also used for the transmission of messages, drugs, pathological specimens, x-ray films and medical records.

Many hospitals and transfusion services are now using pneumatic tube delivery systems as a means of delivering blood products faster and more efficiently. To ensure product safety and the maintenance of quality, system validation is key. The goal of this Guideline is to provide direction when considering pneumatic tube technology for blood component distribution. For facilities currently using this technology, this serves as a comparison between legacy methods and those addressed by the current validation. For institutions using legacy pneumatic tube systems, this document can help direct procedures needed to maintain long-term quality assurance goals.

In the absence of substitutes, the use of blood components remains essential in therapy. This guide contains a compendium of measures designed to ensure the safety, efficacy and quality of blood components and is particularly intended for all those working in blood transfusion services. In accordance with the approach recommended by the Council of Europe in this field, it is based on the premise of voluntary, non-remunerated blood donation. It describes the different blood components and gives information on their clinical indications and possible side effects.
