The systematic study of transformations is the subject of the tensor calculus, to be developed later in more detail; but even at this point it is useful to anticipate a simple convention to distinguish quantities which follow the two transformation laws in (1.9): the indices that label quantities behaving like the basis vectors e_i will be left in the subscript position, but those that label quantities transforming like the vector components

Connecting Weighted Automata, Tensor Networks and ...

One way of simulating some quantum circuits efficiently is using tensor networks. Tensor networks are graphical representations of tensor, which can be thought of as multidimensional arrays of numbers. A rank-0 tensor is just a scalar. A rank-1 tensor is a vector. A rank-2 tensor is a matrix, and so on into higher dimensional arrays that become difficult to visualize after rank-3.
